

Garena AI Build Challenge 2026

Reimagine Digital Entertainment Experiences

Welcome to the Garena AI Build Challenge 2026!

Artificial intelligence is creating new possibilities across digital entertainment: from how content and experiences are created and discovered to how communities are supported and operations are managed.

Your challenge is to identify a meaningful problem within this ecosystem and build an AI-powered solution that creates clear value.

THE CHALLENGE

Design and build an AI-powered product, tool, experience, or workflow that reimagines digital entertainment. Your functional prototype should demonstrate the complete core experience or workflow, and expected features.

Digital entertainment encompasses the content, platforms, communities, creators, and technologies that shape how people play, watch, listen, create, express themselves, and connect with others. Your solution may explore areas such as gaming, streaming, music, video, social platforms and communities, creator tools, virtual worlds, emerging forms of digital entertainment, and beyond.

Your solution may be consumer-facing or built for the people and teams behind these experiences, including audiences, creators, developers, moderators, publishers, operations teams, customer-support teams, and other stakeholders.

There is no single correct solution. You are free to define the problem, target audience, solution format, AI approach, and technology stack. We encourage bold ideas, thoughtful problem-solving, and innovative uses of AI that push the boundaries of digital entertainment.

EXPECTED DELIVERABLES

- Please submit the following three items by sending an email to outreachsg@garena.com with a link to a Google Drive folder containing your deliverables. Ensure that the name of your Google Drive folder accurately reflects your team name.
- Do not modify any part of your deliverables after submission.

1. Slide Deck Proposal

- **Submission format: PDF format with a maximum of 15 slides**
- The proposal should minimally include: problem statement, target users or stakeholders, proposed solution, how AI contributes to the solution, expected impact, as well as technical decisions and implementation details.

2. Source Code of Working End-to-End Prototype

- **Build a functional prototype that demonstrates the complete core experience or workflow, and expected features.**
 - For user-facing products, show how users interact with the solution, how AI contributes, and what outcome is created.
 - For tools or workflows, show the initial trigger or input, key workflow steps, use of models, agents, tools or APIs, human review points (if any), exception handling, and the final output or action.
 - Production readiness is not expected, but static mock-ups or conceptual presentations alone are insufficient.
- **Submit a GitHub repository or equivalent** containing complete source code, a README with setup instructions, an architecture overview, relevant prompts or agent configurations, and disclosure of third-party libraries, models, datasets, and APIs used. Do not include passwords, API keys, or other confidential credentials.
 - If submitting via GitHub, set your repository to private and add **garena-ai-build-challenge** as a collaborator, then include the repository link in your Google Drive submission (e.g. in a Google Doc or text file).
 - If submitting as a folder within your Google Drive submission instead, ensure it contains the same required contents listed above.
- **Build quality of prototypes will be assessed as part of the judging criteria.**

3. Demo Video

- **Submit a demo video of the prototype, maximum 5 minutes in duration.**
- Your video should demonstrate the complete core experience or workflow, and expected features of the working prototype.

JUDGING CRITERIA

- **Problem-Solution Fit (40%)**

This refers to the importance and clarity of the problem, understanding of users or stakeholders, quality of the product or operational insight, strength of the solution, suitability of AI, expected impact, and prioritisation of trade-offs.

- **Build Quality (30%)**

This refers to whether the prototype functions end-to-end and clearly demonstrates the value of the proposed solution in a live setting. Key considerations include reliability, genuine use of AI-driven behaviour, soundness of model, tool, and data integration for the stated use case, and appropriate human review or exception-handling where relevant.

- **Originality (30%)**

This refers to the originality of the problem insight, creativity of the solution, differentiation from existing products or workflows, and uniqueness of execution.

TECHNOLOGY GUIDELINES

There are no prescribed technology restrictions. Teams may use any programming language, AI model, framework, cloud platform, third-party API, open-source software, or low-code or no-code tool.

Teams are responsible for ensuring their solution can be evaluated, disclosing third-party components, complying with applicable licences and usage terms, and protecting confidential or personal information.

TIMELINE

- Deliverables Submission: 9 August 2026
- Finalists Announced: 13 August 2026
- Final Presentations: 23 August 2026
